Q-1 With regard to the mechanisms of cellular adaptation, which of the following statements is TRUE?

- A Hyperplasia refers to an increase in cell size.
- B The myocardium adapts to increased workload by hypertrophy and hyperplasia.
- C Metaplasia is irreversible.
- D Barrett's metaplasia is squamous to columnar epithelium in the distal oesophagus.
- E Barrett's metaplasia is squamous to columnar epithelium with goblet cells in distal oesophagus.

Q-2 A 43-year-old woman has a malignant lymphoma involving lymph nodes in the para-aortic region.

She is treated with a chemotherapy drug agent which results in the loss of individual neoplastic cells through fragmentation of individual cell nuclei and apoptosis. Over the next 2 months, the lymphoma decreases in size, as documented on abdominal CT scans. Which of the following mechanisms has NOT been primarily responsible to this? ²

- A Coagulative necrosis
- B Mitochondrial poisoning
- C Phagocytosis
- D Acute inflammation
- E Apoptosis

Q-3 A 53-year-old man has experienced severe chest pain for the past 20 min. A coronary angiogram is performed emergently and reveals >90% occlusion of the anterior interventricular (left anterior descending) artery. The chest pain stops after ten minutes. In this setting, reversible injury to myocardial fibers will have occurred when which of the following cellular changes occurs?

- A Water content decreases
- B Cytoplasmic sodium decreases
- C Nuclei undergo karyorrhexis
- D unaffected intracellular pH
- E Blebs form on cell membranes

Q-4 A 19-year-old woman gives birth to her first child. She begins breast feeding the infant. She continues breast feeding for almost a year with no difficulties and no complications. Which of the following cellular processes that began in the breast during pregnancy continues for this period of time?

- A Stromal hypertrophy
- B Epithelial dysplasia
- C Steatocyte atrophy
- D Ductal epithelial metaplasia
- E Lobular hyperplasia

Q-5 A 20-year-old woman has blood pressure measurements in the range of 150/90 to 180/110 mm Hg, but does not regularly take medications. A chest x-ray shows an enlarged heart. The size of her heart is most likely to be the result of which of the following processes involving the myocardial fibers?

- A Hypertrophy
- B Fatty infiltration
- C Hyperplasia
- D Fatty degeneration
- E Edema

Q-6 A study is performed to identify predisposing risks for tissue cellular changes. In some persons epithelial metaplasia occurs. In which of the following situations is the process of epithelial metaplasia most likely to take place?

- A Tanning of the skin following sunlight exposure
- B Lactation following pregnancy
- C Vitamin A deficiency
- D Acute myocardial infarction
- E Urinary obstruction from an enlarged prostate

Q-7 A study is performed involving the microscopic analysis of tissues obtained from surgical procedures. Some of these tissues have the microscopic appearance of an increased cell size of multiple cells within the tissue, due to an increase in the amount of cell cytoplasm, with nuclei remaining uniform in size. Which of the following conditions is most likely to have resulted in this finding?

- A Uterine myometrium in pregnancy
- B Female breast at puberty
- C Liver following partial resection
- D Ovary following menopause
- E Cervix with chronic inflammation

Q-8 A 71-year-old man has difficulty with urination. His urinary retention leads to numerous trips to the restroom per day. On digital rectal examination is prostate is grossly & diffusely enlarged. Which of the following represents a pathologic change leading to this man's problem?

- A Dysplasia
- B Hypertrophy

A Hypoplasia
B Metaplasia
C Neoplasia

Hypoplasia

Q-9 A 31-year-old primigravida has a difficult delivery of a term infant, with loss of 1500 ml of blood. She has hypotension for 6 hours. Over the next month, her ACTH level decreases. Within the next 3 months, her adrenal glands become decreased in size. This alteration of the adrenals is primarily due to which of the following cellular processes?

- A Metaplasia
- B Gene mutation
- C Autotoxicity
- D Autophagocytosis
- E Coagulative necrosis

Q-10 A 50 years old diabetic, alcoholic develops reversible hepatic injury. The hepatocytes are distended with yellow colored substance creating vacuoles in cytoplasm. What kind of substance actually has accumulated

- A Glycogen
- B water
- C Fat *Fat*
- D Mucin
- E Melanin

Q-11 A 17-year-old man develops marked right lower quadrant abdominal pain over the past day. Laparoscopic surgery is performed, and the appendix was acute inflamed and a microscopic section shows infiltration with numerous neutrophils. The pain experienced by this patient is of which of the following two chemical mediators?

Prostaglandin

- A. Complement C3b and IgG
- B. Interleukin-1 and tumor necrosis factor
- C. Histamine and serotonin
- D. Prostaglandin and bradykinin
- E. Leukotriene and HPETE

Q-12 A 48-year-old woman has had a cough with fever for 3 days. A sputum culture grows *Streptococcus pneumoniae*. The clearance of these organisms from the lung will be accomplished through generation of which of the following substances by the major inflammatory cell type responding to this infection?

- A. Platelet activating factor
- B. Prostaglandin E2

• Physiology (Q No. 2) c 17

- A. Kallikrein
- B. Leukotriene B4
- C. Hydrogen peroxide

Q-13 A 12 years old boy **pharyngeal infections** and experience fever and chills. On physical examination, the most common findings include swelling, erythema, and **pharyngeal purulent exudate**. Which of the following types of inflammation did these patients most likely have?

- A. Granulomatous
- B. **Pyogenic**
- C. Gangrenous
- D. Resolving
- E. Chronic

Q-14 A 43-year-old woman has had a chronic **cough with fever and weight loss for the past month**. A chest radiograph reveals multiple nodules from 1 to 4 cm in size, some of which demonstrate cavitation in the upper lobes. Which of the following cells is the most important in the development her lung lesions?

- A. Macrophage
- B. Fibroblast
- C. Neutrophil
- D. Mast cell
- E. Platelets

Q-15 A 70-year-old man has experienced painful urination for 4 days. Numerous neutrophils are present in a smear of the exudates, from the penile urethra. These neutrophils undergo diapedesis to reach the organisms. Release of which of the following chemical mediators is most likely to drive neutrophil exudation?

- A. Histamine
- B. Prostaglandin
- C. Hageman factor
- D. Bradykinin
- E. **Complement**

Q-16 A 64-year-old woman has **Infection Staphylococcus aureus**, and got antibiotic therapy. After 02 weeks a chest radiograph reveals a 3 cm rounded density in the right lower lobe whose liquefied contents form a central air-fluid level. Which of the following is the best description for this outcome of her pneumonia?

- A. Hypertrophic scar
- B. **Abscess formation**
- C. Regeneration
- D. Bronchogenic
- E. Chronic inflammation

- D. Six months
E. One year

Q-22 A 19-year-old man incurs a stab wound to the chest. Two months later there is a firm, 3 x 2 cm nodular mass with intact overlying epithelium in the region of the wound. This mass is excised and microscopically shows fibroblasts with abundant collagen. Which of the following mechanisms has most likely produced this series of events?

- A. Keloid formation
B. Development of a fibrosarcoma
C. Poor wound healing from diabetes mellitus
D. Foreign body response from suturing
E. Staphylococcal wound infection

Q-23 An 11-year-old child falls and cuts his hand. The wound becomes infected. Bacteria extend into the extracellular matrix around capillaries. In the inflammatory response to this infection, which of the following cells removes the bacteria?

- A. B lymphocyte
B. Fibroblast

- C. Macrophage
D. Mast cell
E. T lymphocyte

Q-24 A woman who is allergic to cats visits a neighbor who has several cats. During the visit, she inhales cat dander, and within minutes, she develops nasal congestion with abundant nasal secretions. Which of the following substances is most likely to produce these findings?

- A. Bradykinin
B. Complement C5a
C. Histamine
D. Interleukin-1 (IL-1)
E. Phospholipase C

Q-25 A 41-year-old man has had a severe headache and fever. Lumbar puncture is performed, and the cerebrospinal fluid obtained has a WBC count of 910/mm³ with 94% neutrophils and 6% lymphocytes. Which of the following substances is the most likely mediator for the fever observed in this man?

- A. Bradykinin
B. Histamine
C. Leukotriene B4
D. Nitric oxide
E. Tumor necrosis factor (TNF)

Date: _____

Q-1 In a road side accident, a lacerated wound was inflicted on thigh of a young man. It got infected and took the longer time to heal with irregular scar formation.

- a. Describe in chronological order the sequential steps of changes at local site of for this scar formation.

sound 89 Robins
infection - osteomyelitis 03
wound scar formation 02
Necrosis - edema
Hematoma

Step 1: Plaque plug formation
↓
Inflammation
↓
cell proliferation
↓
Remodeling

- b. What are complications of wound healing?

wound scar formation
